
Attractor basin (2D) — $N = 4$ kernels, $D_{\text{eff}} = 3.00$, predecessor law
(a) Top-down projection
(darker = lower potential)
k_1 (9.8°)
k_0 (9.2°)
k_2 (10.4°)
k_3 (18.1°)
$\theta_{PSI} = 18.21°$
mean obs: 9.8°
Stasis $\mathbf{s}^*$
$\xi_1 = \sin\theta\cos\phi$
$\xi_2 = \sin\theta\sin\phi$
$V(\theta) = 1 - \cos\theta$
(b) Radial potential profile
$V(\theta) = 1 - \cos\theta$
$\theta_{PSI} = 18.21°$
mean obs: 9.8°
basin interior
observed kernels
Lyapunov potential $V(\theta)$
Angular deviation θ (degrees)
