Viability under sustained noise $V(\sigma)$ (EXP-NS-01)
$V(\sigma) = \min(g, c, t, m(\sigma)) = m(\sigma)$
saturates ≈ 0.33 (no finite ceiling)
moderate $\sigma = 0.10$: $V = 0.71$
rev.3 proxy $V \approx 0.46$
(extreme regime)
confinement $P(\cos \geq 0.70) = 1.0000$ for all $\sigma \leq 2.0$
$\Rightarrow$ no finite noise ceiling; $\varepsilon_{\text{frontier}} = 0.775$
$V(\sigma)$ (margin-limited)
