
Attractor basin (2D) — $N=4$ kernels, $D_{\text{eff}}=3.00$, predecessor law
(a) Top-down projection
(darker = lower potential)
k_1 (9.8°)
k_0 (9.2°)
k_2 (10.4°)
k_3 (16.1°)
$\theta_{PSI}=18.21\gamma$
mean obs: 9.8γ
Stasis s^*
$\xi_2=\sin\theta\sin\phi$
$\xi_1=\sin\theta\cos\phi$
$V(\theta)=1-\cos\theta$
(b) Radial potential profile
$V(\theta)=1-\cos\theta$
$\theta_{PSI}=18.21\gamma$
mean obs: 9.8γ
basin interior
observed kernels
Lyapunov potential $V(\theta)$
Angular deviation θ (degrees)
